Information on Forklift Sweepers

A forklift sweeper is an attachment that makes it possible to sweep debris from warehouses, docks, parking lots, construction sites, and other areas that have floor space. A sweeper can be used with wet or dry material. In addition to this, a sweeper is capable of squeezing water and/or pushing snow. A sweeper attaches to a forklift truck using quicktite fork pockets. Many have 8 inch high bristles that are mounted on a light aluminum frame.
