

Information on Forklift Booms

A forklift boom transforms a forklift into a mobile crane. The boom is quite versatile because it can rotate and swivel, and thus allows the operator a variety of different motions to utilize. The boom is generally placed in the position where the forks of the forklift would have been located. A Forklift Boom can be built to accommodate different jobs and thus you will find many different options in regards to length and specifications. The industry average length is roughly 12 feet long. These attachments are capable of lifting a load of up to roughly 3,000 pounds.
