

Information on Forklift Extensions

A fork extensions is meant to provide extra support that can help lift and manage large objects. These extensions are composed of welded steel, using cast steel tips. They are generally fastened to the forks with the help of steel retaining straps, so that they do not slide off the forks. It is very common to see the extensions being given a powdered coat yellow finish. Note that OSHA regulations state very specifically that fork extensions can not be more than fifty percent of the existing fork length.
